

# AI-agent screening recovers 90.5% of manually curated papers and surfaces 244 additional candidates

Areas proportional to set size; one assignment = one (scope, paper) curation decision.  
Recall vs. manual =  $182/201 = 90.5\%$ . Expansion =  $2.12\times$ . Jaccard =  $40.9\%$ .  
Unique papers (deduplicated across scopes): both 175, AI only 222, manual only 17.  
Separately, 73 legacy assignments inherited from ssREAD are excluded above (different date coverage; not a third curator).
